# AICTE Officer Dashboard: Design Brief

SIH 2026, PS SIH26264. The feel of the reference dashboard, and how to adapt it for the officer dashboard (base for the Claude Code prompt).

## 1. What makes the reference dashboard work

### Layout

- It has three zones: a slim left sidebar for navigation, a thin top bar (search, notifications, profile), and a large content area. Nothing else competes for attention.
- The content area is built from cards on a soft grey-white background. Each card is white with rounded corners and a very faint shadow, so the cards look like they float.
- The grid is strict. The top row is four equal KPI cards. Below that is one wide card next to one narrow card. Below that is a second row of three cards. Everything aligns, which makes the page feel calm.
- There is one primary action button in the top-left ("Register patient"), in the strongest colour on the page. You always know what the main thing to do is.

### Colour

- Mostly white and very light grey. One dominant accent (purple) is used for the primary button, the active nav item and the main data series.
- A second accent (green) and a third (orange) appear only to separate data series. Each colour has one job.
- The one fully coloured card (the purple "3,240 patients this month") is the single highlight on the page. It is how the eye knows what matters most.

### Typography and spacing

- One clean sans-serif font. There are only three sizes: big bold numbers, medium card titles, small grey labels.
- Generous padding inside cards and large gaps between them. White space is the main design tool.

### Data presentation

- Each KPI card holds one number, one label and one soft-coloured icon. No clutter.
- Charts are simple: thin rounded bars, a smooth area line, and a donut with a single percentage. There are no heavy gridlines and no 3D effects.

- Every chart has a small dropdown for the time range ("Show by months", "Today"), so filtering feels light.
- A tooltip bubble (the "28%" and "113" markers) gives detail on hover, so the card itself stays clean.

**Interaction feel**

- Detail appears on hover or click, not all at once.
- Icons are simple and rounded, always paired with a text label.

The word that sums it up is **quiet**. The dashboard looks intuitive because each card answers exactly one question.

## 2. What we should keep, and what we should change

**Keep:** the sidebar + top bar + card grid structure, the KPI row, the single accent colour, soft shadows, rounded corners, the donut and smooth-line chart style, hover tooltips, and the one highlighted card.

**Change, so it does not look like a copy and fits a government use case:**

- Use a different palette. The earlier direction was white with a teal or deep blue accent, which suits this. Avoid purple.
- Use different card shapes and proportions. Make the map the hero of the page instead of a bar chart.
- Replace all hospital wording and icons with complaint and college concepts.
- Add things the reference does not have: a priority list, SLA timers, a verification queue and the hologram map.

## 3. The officer's home screen (Madhya Pradesh example)

**Top bar:** search by case ID, college name or AICTE ID; a notification bell for SLA alerts and overlap alerts; the officer's name, bureau and region (for example "Regional Office – Bhopal"). Because the state is fixed by the officer's login, the dashboard opens already scoped to Madhya Pradesh.

**Left sidebar** (icon + label, active item shown in the accent colour):

1. Overview
2. Map

3. Complaints (pending, under processing, solved views)
4. Priority list
5. Colleges (institution profiles)
6. Overlaps
7. Officers / Action history
8. Reports
9. Feedback
10. Settings

**Primary button (top of sidebar):** because complaints arrive from the AICTE portal, "register complaint" does not apply. Use something useful for the officer instead, such as "Open next priority case". It is the one strongest-coloured button on the page.

## Row 1: four KPI cards

Each card has one big number, a small label and a soft icon, as in the reference.

- **Pending**: new cases not yet taken.
- **Under processing**: cases marked "Taken", with a tiny note of how many are close to their SLA deadline.
- **Pending verification**: cases marked solved and waiting for the complainant.
- **SLA breached / at risk**: the number the officer should worry about.

Show "solved" as a share in a donut elsewhere, so the row stays focused on action.

## Row 2: the hero area (map + priority list)

This is where the hologram feature lives. Two layouts are possible:

- **Option A (recommended): map in the middle, priority list on the right.** The map is the first thing the officer sees, and the priority list sits where the eye goes next, in a narrow tall card. This mirrors the reference's "wide card + narrow card" rhythm, so it stays familiar.
- **Option B: map on the right, priority list in the middle.** Better if the team wants the work queue to be the main thing and the map to be supporting.

Option A is recommended. The map is the wow factor for the judges, and a tall narrow priority list reads naturally as a to-do queue.

**The holographic Madhya Pradesh map (centre card)**

- A dark, translucent 3D-style state map, tilted slightly, with a faint glowing outline and a subtle grid or scan-line effect beneath it. A card with a dark navy background would also make it the one highlighted card, as the purple card is in the reference.
- District boundaries are drawn as thin glowing lines. Hovering a district lifts it slightly and shows a tooltip (district name, number of colleges, number of open complaints).
- **Dots for colleges:** each dot is one college. Dot colour shows the state of its complaints: calm teal for no open complaints, amber for open, red for SLA-breached or high priority. Dot size can grow with the number of complaints.
- Clicking a district zooms in and shows only that district's colleges. Clicking a dot opens a small side panel with the college profile summary (AICTE ID, open cases, repeat-complaint count) and a "View profile" button.
- A small legend (three colours) and a breadcrumb ("India > Madhya Pradesh > Indore") sit at the corner of the card. A "back" control returns to the state view.
- Keep the effect subtle. A slow ambient glow and a gentle pulse on red dots is enough. Too much animation will look gimmicky and will hurt performance.

**Priority list (right card)**

- A vertical list of the top 5 to 8 cases, each row showing a priority tag (high, medium, low), the college name, the complaint category, the case ID and a small SLA countdown.
- Repeat-complaint cases (same person, same issue, twice in a week) get a small "repeat" badge and sit higher.
- Each row has two small buttons: **Taken** and **Solved**. Only the officer's own bureau's cases appear.
- A "View all" link opens the full Priority list page.

## Row 3: analytics cards

Keep these graph-first, as decided: numbers appear on hover or click.

| Card | Chart type | What it shows |
|---|---|---|
| Status split | Donut | Pending, under processing, pending verification, solved, unverified. The centre shows the total and the percent solved. |

| Card | Chart type | What it shows |
|---|---|---|
| Complaints over time | Smooth area/line with a "by week / by month" dropdown | New vs resolved cases, so the officer sees if the backlog is growing. |
| Complaints by category | Horizontal bars | Fee fraud, malpractice, hostel, and so on, so the officer sees what is driving the load. |
| SLA health | Ring or segmented bar | On time, at risk, breached. It gives the officer a quick sense of whether they are on track. |
| Top colleges by repeat complaints | Compact ranked list with tiny bars | Chronically problematic colleges, which feeds the action history feature. |

Each card has its own small filter dropdown, as in the reference. A global filter bar above the grid (bureau, district, category, date range) applies to everything for the multi-filter reports requirement.

### One highlighted card

Use a single coloured card, as the reference does, for the most important summary. The map card in dark navy works for this. If the map uses a light background, then make the "SLA at risk" card the coloured highlight instead. Pick one, not both.

## 4. Other screens (kept simple)

- **Complaints page:** a clean table with tabs (Pending, Under processing, Pending verification, Solved). Columns: case ID, college, category, bureau, assigned officer, date received, SLA remaining, status. Clicking a row opens a right-hand drawer with the case timeline.
- **Case detail drawer:** top shows the case ID, status chip and priority. Below it is a vertical timeline (the audit trail), the linked cases (overlap), the proof upload area (for Solved), and the Taken / Solved buttons.
- **Overlap alerts:** cards that say "Same college, same issue, also with PGRC", with a "Link cases" button. It is a short, clear list.

- **College profile:** the college name and AICTE ID at the top, a mini timeline of all its cases, a repeat-complaints chart, and its location dot on a small map.
- **Officers / Action history:** a table or card per officer with three small numbers (solved, under processing, pending) and a tiny bar. Senior admins see it for the whole bureau.
- **Reports:** filters on top, a preview below, and an export button.
- **Feedback:** a small floating button at the bottom-right opens a one-field popup.

## 5. Student dashboard (separate and read-only)

Keep the same visual language but make it simpler: the student sees "My complaints" as cards with case ID, a status chip and a progress timeline. When a case is marked solved, a highlighted card shows the officer's proof with **Confirm** and **Reject** buttons and the 7-day countdown. Nothing else is on the page.

## 6. Roles change what the officer sees

- **Bureau officer:** only their bureau's cases, with Taken / Solved actions.
- **Regional office:** all cases in their region; the map is scoped to the region or state.
- **Senior admin:** all bureaus, escalations, officer performance and the national map (with state drill-down).
- **Student:** only their own complaints.

## 7. Visual rules for Claude Code

- **Palette:** white cards on a very light grey-blue page; one deep teal or navy accent; amber and red used only for status warnings; soft pastel backgrounds behind icons.
- **Font:** a single rounded sans-serif (Poppins, Inter or Plus Jakarta Sans). Three sizes only.
- **Cards:** 16px radius, very soft shadow, 24px padding, 24px gap between cards.
- **Icons:** one consistent line-icon set (such as Lucide).
- **Charts:** Recharts with thin rounded bars, no heavy gridlines, smooth curves, small legends and hover tooltips.
- **Motion:** short fade or slide-in on load, hover lift on cards, smooth map zoom. Nothing flashy beyond the map.
- **Empty and loading states:** simple skeleton cards, never blank screens.
- **Desktop only** for the prototype.

## 8. The hologram map: technical suggestions

- The tech stack lists Leaflet with India GeoJSON. Leaflet is a flat 2D map, so it will not give a true hologram look by itself. For the hologram view, use **deck.gl, Three.js or MapLibre with a tilted pitch and extruded districts**. A tilted, extruded MapLibre view with a dark style and glowing outlines is the quickest route to the effect.
- If time is short, a **tilted SVG of Madhya Pradesh** with CSS glow and a perspective transform, with dots placed on top, gets about 80% of the look at a fraction of the effort. Start with this and upgrade only if time allows.
- Use real district GeoJSON for Madhya Pradesh. College dots can use latitude and longitude from the sample data.
- Because the prototype uses sample data, make sure it includes a believable spread: around 40 to 60 colleges across several districts, with a mix of calm, open and breached dots.
- One thing to keep in mind: the tech stack slide says Leaflet, so if the final map uses MapLibre or Three.js, the PPT and the prototype will differ. This is fine because the PPT describes the full app, but keep the map library name in mind in case a judge asks.

## 9. Sample data the prototype should include

So the dashboard looks alive on the first load, ask Claude Code to seed: about 50 colleges with AICTE IDs and districts, 150 to 200 complaints across categories and statuses, a handful of repeat-complaint cases, a few overlap pairs, a few SLA-at-risk and breached cases, and 5 to 6 officers with different solved and pending counts.

## 10. Decisions needed before writing the Claude Code prompt

1. **Map placement:** Option A (map in the middle, priority list on the right) or Option B. Option A is recommended.
2. **Map style:** dark holographic card (which also serves as the highlighted card) or a light card with a glowing outline.
3. **Primary sidebar button:** "Open next priority case", or something else.
4. **Accent colour:** teal or deep navy.
5. **Hologram approach:** true 3D (MapLibre/deck.gl/Three.js) or tilted SVG. Starting with the tilted SVG is suggested.

Once these five points are decided, this brief can be turned into a single, well-structured prompt for Claude Code, split into steps so that it builds the layout first, then the map, then the working flow, which keeps token use low.
